

How to Install dQuery from a Download

The downloaded version of dQuery Installer is contained in a self-extracting file. Before running the installer, you must extract the installer by running the downloaded file as follows:

- Click the Windows Start menu and select Run.
- In the Run dialog, select Browse to open the File Selection dialog.
- In the File Selection dialog, navigate to the disk drive and folder where you downloaded the dQuery installer zip file.
- Select the downloaded file and press the Open button.
- In the Run dialog, click on the OK button to run the file.
- Click OK when the dialog similar to the following is displayed:

- When the following dialog appears, note the default folder where the installer files will be placed when extracted. If you wish to change the unzip folder, you can do so now. When ready, click the Unzip button to start the extraction process.

- When done unzipping, click on OK to close the self-extractor status dialog.

At this point, the dQuery installer should start automatically and display the first screen of the installer menu. Refer to the dQuery *Installation and Setup Guide* for the steps to install dQuery and a description of the installation options.

To restart the installer menu for the downloaded version of dQuery, return to the folder where the installer files were unzipped and run the file, `dgsa-setup.exe`, to start the Setup Program.
